ADDENDUM REPORT

Re: Athena CASTANEDA
DOB: 09/25/2021
Case No.: J290945

Re: Ellenore CASTANEDA
DOB: 06/17/2020
Case No.: J290946

Related siblings: Eireh Castaneda (DOB 08/25/2022)
Austin Aparicio (DOB 01/07/2016)

To Whom It May Concern:

I have been asked to reexamine and evaluate the cases involving specifically Athena and Ellenore Castaneda, as well as associated siblings, Austin and Eireh. I am also in receipt and review of my previous letter of October 2, 2022, concerning Athena and Ellenore. In addition, I note further medical records on Athena and Ellenore have shown some evidence of bone dyscrasia. Those records include alterations in alkaline phosphatase, and including other enzymes, evidence of decreased vitamin D in Athena, increased elevated creatinine kinase in Ellenore, as well as potential evidence of bone abnormalities in both children.

In addition, I specifically note that in the case of Athena, the original skeletal survey of October 16, 2021, appeared to indicate evidence of metaphyseal corner fractures involving the right and left tibias. Of note, the follow up skeletal survey of November 9, 2021, showed that those metaphyseal corner fractures were no longer visible. This can be reflective of the fact that the original images were indeed not metaphyseal corner fractures, but some other normal bony variant, or there was otherwise atypical healing of the metaphyseal corner fractures. Typically, metaphyseal corner fractures heal with copious callus formation that is seen in the subperiosteal region of the bone adjacent to the metaphyseal corner fracture. This was clearly not present on the follow up skeletal survey of November 9, 2021.

In addition, I note that siblings Austin and Eireh, who had skeletal surveys performed on October 7, 2022, and October 17, 2021, in the case of Austin, failed to show any bony abnormalities or fractures.

Re: Athena and Ellenore CASTANEDA

In my professional opinion, the specific etiology of the fractures noticed on Athena and Ellenore need to be given more scrutiny in light of this new information.

Sincerely yours,

Thomas J. Grogan, M.D.
Diplomate, American Board of Orthopaedic Surgeons
